Gamma Spectroscopy Results

Future Work

Motivation

- Current Events
 - Joint Comprehensive Plan of Action
 - Non-safeguarded reactors
 - Islamic State of Iraq and Syria
- Past Events
 - Septemer 11, 2001
- Limited scope of IAEA safeguards
- * "the awful arithmetic of the atomic bomb" [?]
- ❖ Need for improved forensic capabilities^[? ? ?]

Definitions

- Special Nuclear Material (SNM)
 - ➤ Plutonium, ²³³U, or ²³⁵U
- Nuclear Forensics
 - The investiative activity that surrounds the search for attributes of undetermined radioactive specimens for the purpose of attribution.
- SNM origin attributes/indicators
 - Indicators or clues for SNM origin attribution. Examples include burnup, fluence rate, initial fuel enrichment, fuel age, and fast-to-thermal irradiation ratios
- Decontamination Factors (DF)
 - A measure of the effectiveness with which a product is decontaminated from a contaminant

$$DF_j = \frac{\frac{c_j}{c_{Pu}}|\text{initial}}{\frac{c_j}{c_{Pu}}|\text{final}}$$

National Context

"The United States has developed a nuclear forensics capability that has been demonstrated in real-world incidents of **interdicted materials** and in exercises of actions required after a nuclear detonation. The committee, however, has concerns about the program and finds that without strong leadership, careful planning, and additional funds, these capabilities will decline" [?]

Major areas of concern include:

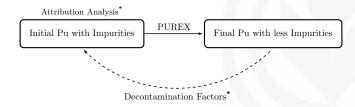

- Organization
- Sustainability
- Workforce and Infrastructure
- * Procedures and Tools

Forensic Context

- Nature of inverse problems
- Plutonium purification necessary for weapons production

$$^{238}U + n \rightarrow ^{239}U \xrightarrow{\beta^{-}} \xrightarrow{T_{1/2}=23 \text{ min}} ^{239}Np \xrightarrow{\beta^{-}} \xrightarrow{239} Pu$$

Attribution for unpurified Pu has been previously studied
 [? ? ?]

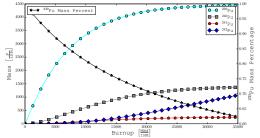

Nuclear Context

- ❖ Weapons-grade Pu can be extracted from reactor discharged fuel with a burnup of about 1 (GWD/tU)
- Pu isotopes produced in irradiated fuel can vary
- Two examples of reactors which can intentionally discharge low burned fuel for extracting weapon-grade Pu are:
 - Fast Breeder Reactor, CANDU Reactor

Chemical Context

- Plutonium Uranium Redox EXtraction (PUREX)
 - Liquid-liquid solvent extraction
 - Many stages:
- Distribution Coefficient (D): The ratio between the organic and aqueous phases (aka: D-values)

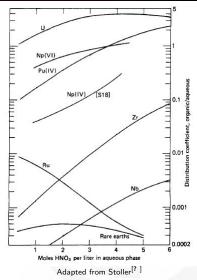

$$D = \frac{c_o}{c_{aq}}$$

- Specific element to element
- Vary widely^[?]
- The fraction of mass, f_o deposited in the organic phase, assuming a volume ratio between the aqueous and organic phases, V_R , is:

$$f_o = (1 + D^{-1}V_R^{-1})^{-1}$$

Chemical Context

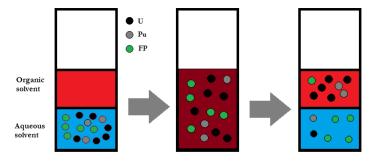

- Lack of literature on decontamination factors and distribution coefficients for useful forensic elements (Cs, Sb, Eu, Rb, Sr, Nd, Pm, and Sm)
- With a known process and D-values, DF values for individual elements can be determined

Extraction

$$\begin{array}{l} UO_{2(aq)}^{2+} + 2NO_{3(aq)}^{-} + 2TBP_{(o)} \leftrightarrow UO_{2}(NO_{3})_{2} \cdot 2TBP_{(o)}^{[?]} \\ Pu_{(aq)}^{4+} + 4NO_{3(aq)}^{-} + 2TBP_{(o)} \leftrightarrow Pu(NO_{3})_{4} \cdot 2TBP_{(o)} \end{array}$$

Add clean immiscible organic solvent phase

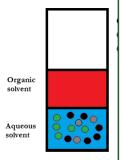

Shake or stir to allow molecules to partition

Phases settle and separate with gravity

Extraction

$$UO_{2(aq)}^{2+} + 2NO_{3(aq)}^{-} + 2TBP_{(o)} \leftrightarrow UO_{2}(NO_{3})_{2} \cdot 2TBP_{(o)}^{[?]}$$

$$Pu_{(aq)}^{4+} + 4NO_{3(aq)}^{-} + 2TBP_{(o)} \leftrightarrow Pu(NO_{3})_{4} \cdot 2TBP_{(o)}$$

Add clean immiscible organic solvent phase

Final
$$(D = \frac{c_{o,f}}{c_{A,f}})$$
:

$$M_{tot} = c_{A,f} V_A + c_{o,f} V_o \label{eq:mtot}$$

 $M_{tot} = c_{A,i}V_A$

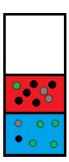

Solving for $c_{o,f}$ in terms of D:

$$c_{o,f} = \frac{M_{tot}}{V_A \perp V}$$

Solving for $\frac{c_{A,i}}{c_{\alpha,\ell}}$:

$$\frac{c_{A,i}}{c_{o,f}} = \frac{\frac{V_A}{D} + V_o}{V_A} = \frac{1}{D} + \frac{V_o}{V_A} \label{eq:cases}$$

partition

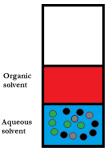

Phases settle and separate with gravity

Extraction

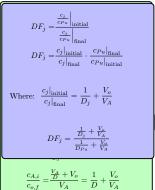

$$UO_{2(aq)}^{2+} + 2NO_{3(aq)}^{-} + 2TBP_{(o)} \leftrightarrow UO_{2}(NO_{3})_{2} \cdot 2TBP_{(o)}^{[?]}$$

 $Pu_{(aq)}^{4+} + 4NO_{3(aq)}^{-} + 2TBP_{(o)} \leftrightarrow Pu(NO_{3})_{4} \cdot 2TBP_{(o)}$

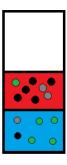

Add clean immiscible organic solvent phase

02/27/2017

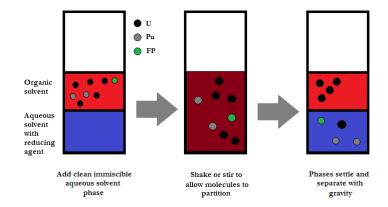

$$\frac{c_{A,i}}{c_{o,f}} = \frac{\frac{V_A}{D} + V_o}{V_A} = \frac{1}{D} + \frac{V_o}{V_A}$$

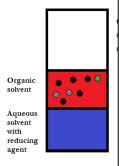

Phases settle and separate with

$$Pu(NO_3)_4(\textit{TBP})_{2(o)} + \textit{Fe}_{(aq)}^{2+} \leftrightarrow Pu_{(aq)}^{3+} + 4NO_{3(aq)}^{-} + 2\textit{TBP}_{(o)}^{\cite{O}}^{\cite{O}}$$

$$Pu(NO_3)_4(TBP)_{2(o)} + Fe_{(aq)}^{2+} \leftrightarrow Pu_{(aq)}^{3+} + 4NO_{3(aq)}^{-} + 2TBP_{(o)}^{[?]}$$

Add clean immiscible aqueous solvent phase

Initial:

Final $(D_2 = \frac{c_{o,f2}}{c_{A2,f}})$:

$$M_{org} = c_{A2,f} V_{A2} + c_{o,f2} V_o \label{eq:morg}$$

 $M_{ora} = c_{o,f}V_o$

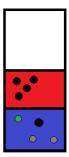

Solving for $c_{A2,f}$ in terms of D_2 :

$$c_{A2,f} = \frac{M_{org}}{V_{A2} + D_2V_2}$$

Solving for $\frac{c_{A,i}}{c_{A2,f}}$ (note: $c_{A,i}$ is from the *initial* aqueous phase):

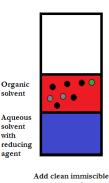

$$\frac{c_{A,i}}{c_{A2,f}} = \! \frac{1}{f_o} \frac{V_{A2} + D_2 V_o}{V_A}$$

partition

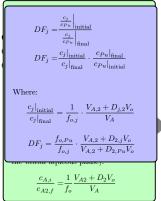

Phases settle and separate with gravity

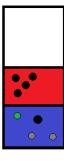

$$Pu(NO_3)_4(TBP)_{2(o)} + Fe_{(aq)}^{2+} \leftrightarrow Pu_{(aq)}^{3+} + 4NO_{3(aq)}^{-} + 2TBP_{(o)}^{[?]}$$

Add clean immiscible aqueous solvent phase

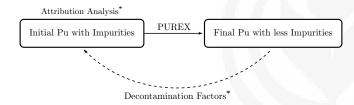

partition

Phases settle and separate with gravity

Decontamination Factors and their use

- After several cycles of Pu extraction/scrubbing/back-extraction are completed, the effectiveness of a PUREX cycle is described by the decontamination factor (DF):
- DFs are characteristic of different process cycles
- Larger values (10⁷) for industrial scale PUREX (compared to benchtop)^[? ?]

Objectives I

Characterize a 4 extraction 3 back-extraction PUREX process

Collect D-values for each step

$$^{147} \mathrm{Pm}^{*}$$
, $^{151} \mathrm{Sm}^{*}$, $^{154} \mathrm{Eu}^{*}$, U^{*} , Pu^{*} (Mass Spec)

- Convert all mass spec data to D-values
- Collect DF-values for the process
 - Prepare alpha samples for each step (triplicate)
 - Analyze alpha samples for each step
 - □ Convert alpha spec + gamma spec data to DF values
 - Convert Mass spec data to DF values (published)
- Mathematically connect D-values to DFs
 - Derive equations with uncertainty propagation
 - Analyze connection with uncertainty

Objectives II

Determine attribution indicators:

 Mathematically derive equations for above indicators with respect to one of the isotopes determined above

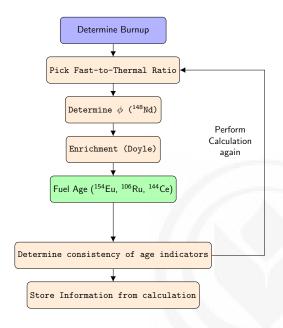

- Fast-to-thermal ratios (requires iteration)
- Program a system to iteratively solve for these parameters given heavy metal concentration ratios
 - Make a program that can read ENDF files for x-sections
 Create/Use a bateman solver with automated x-section modifications
 Create program to calculate single group x-sections from ENDF data and an assumed fast-to-thermal ratio
 - Couple all programs together in a single program
- Use above information to determine indicators for three sets of data

Present Status of the Question

- Stable noble fission gases as burnup verification^[?]
- Determine burnup, enrichment, and fuel age from used fuel in a RDD^[?]
- Analysis of purified plutonium isotopics for reactor type^[?]
- PUREX co-processing DF values for U and Pu^[?]
- PUREX D-values and DF values under numerous circumstances^[? ? ? ? ? ?]
 - ➤ DF values for ¹⁰⁶Ru and ⁹⁵Zr^[?]
 - Compilation of D-values for U, Th, and Pu^[?]
 - ➤ D-values for rare earths, Pu, Th[??????????]
 - ➤ Ga D-values[?]

Procedure

Analytical Procedure

♦ 12.9±0.1 mg of DUO₂ irradiated at HFIR

$$\begin{split} \frac{dn_i}{dt} &= -\lambda_i^{eff} \, n_i + \sum_{j=1}^N b_{j \to i}^{eff} n_j \\ \lambda_i^{eff} &= \lambda_i + \phi \sum_{j=1}^N \sigma_{i \to j} \\ b_{j \to i}^{eff} &= b_{j \to i} \lambda_j + \sigma_{j \to i} \phi + \gamma_{j \to i} \sigma_{j,f} \phi \\ \frac{d\vec{n}}{dt} &= \mathbf{A} \vec{n}(t) \to \vec{n} = e^{\mathbf{A}t} \vec{n}_0 \end{split}$$

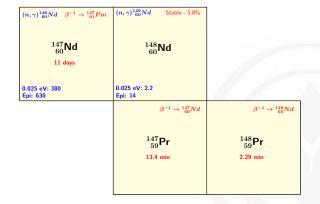

Analytical Procedure - Burnup

- Operational Parameter
- Calculated:
 - Specific heat calculation on working fluid
 - Number and isotopes that fission in the system
 - burnup isotope indicator

$$BU = \frac{\text{Power}[\text{MW}] \cdot \text{days}}{m[\text{HM}]}$$
$$= \left[\frac{N^B}{N_0^{HM}}\right] \frac{N_A E_R}{\gamma_B} \cdot \frac{1}{M_0^{HM}}$$

$(n,\gamma)^{137}_{55}Cs$ $\beta^{-1} o {}^{136}_{56}Ba$	$(n,\gamma)^{138}_{55}Cs$ $\beta^{-1} \to {}^{147}_{56}Ba$	
136 Cs 55 Cs 13 days	¹³⁷ ₅₅ Cs	
0.025 eV: 11 Epi: 57	0.025 eV: 0.2 Epi: 0.3	///
	$(n,\gamma)^{137}_{54}Xe$ Stable 8.9%	$\beta^{-1} \rightarrow {}^{137}_{55}Cs$
	¹³⁶ ₅₄ Xe	¹³⁷ Xe ^{3.8} min
	0.025 eV: 0.2 Epi: 0.1	

Analytical Procedure - Fluence Rate

- Burnup Indicator assumptions
 - Short lived precursors of same mass bin with small cross sections
 - > Small contributions from other mass bins
 - Stable

$$\phi \approx \frac{\lambda_7}{\sigma_7 \left(\frac{\gamma_7}{\gamma_8^* - \gamma_8} - 1\right)}$$

- Assumptions:
 - \triangleright Build in can be described by constant ϕ , single group x-sections
 - ightharpoonup Constant fissionable material, σ_a for 148 Nd ≈ 0
 - Cumulative yeild instantly arrives at ¹⁴⁷Nd
 - Utilizes a taylor series expansion

Analytical Procedure - Initial Enrichment and Fuel Age

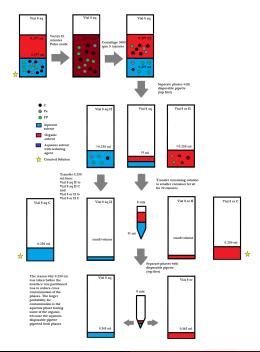

Initial Enrichment

- Heavy metal converts to heavier metal and to Fission products
- Account for in Burnup, and mass in heavy metals
- Solution assumes all higher actinides are built into the system from capture in ²³⁸U

$$\epsilon_0 = \frac{N^{U238}(T)}{N_0^U} \left[\frac{N^{U235}(T)}{N^{U238}(T)} + \frac{N^{U236}(T)}{N^{U238}(T)} \right] + \frac{M_0^U}{N_A E_R} BU(T) - G^{238} - G^{240} - G^{241}$$

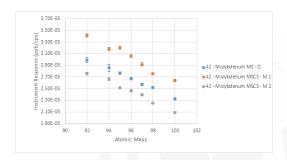

Fuel Age

$$t_d = -\frac{1}{\lambda} ln \left(\frac{N_{\text{measured}}}{N_{FOI}} \right)$$

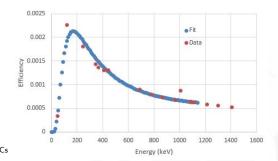

Experimental Procedure - Mass Spectrometry

- NexION 300X quadrupole
- 7 different concoction standards (including Pu and U standards)
- Two point calibration curves
- Extrapolation for radioactive species

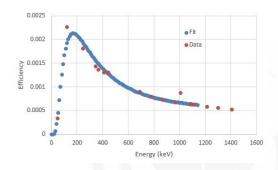

Experimental Procedure - Gamma Spectrometry

- Canberra electrode coaxial HPGe
- ¹⁵²Eu liquid calibration source
- Program written to extract and analyze
 26 gamma peaks
 155 Eu, 154 Eu, 144 Ce, 125 Sb, 106 Rh, 134 Cs, 137 Cs

Experimental Procedure - Alpha Spectrometry

- Passivated implanted planar silicon (PIPS) detector
- 4-peak Pu, Am, Gd, and Cm source from Eckert and Ziegler
- Samples prepared by evaporating 10-20 μl on aluminm surface
 239 Pu 240 Pu 241 Am

Current and Expected Results

Irradiation

- 12.9 \pm 0.1 mg of DUO₂ was irradiated
 - High Flux Isotope Reactor at Oak Ridge National Laboratory
- * Burnup was 4.43 ± 0.31 GWd/tHM^[?] from ¹³⁷Cs
- * $0.196 \pm \text{mg}$ of total Pu was produced as measured by ICP-MS

Dissolution of the spent fuel pellet

Glovebox

Experiments

- Single stage extraction and back-extraction
 - Purpose: quantify product recovery, D-values and DF values for single stage extraction and back extraction
 - Conditions:

Starting Solution Extraction Solution		Back extraction solution	
4 M nitric acid	30% vol.% TBP, 70 vol.% kerosene	0.024 M ferrous sulfamate in 0.75 M nitric acid	

- Multi-contact extraction and back-extraction
 - Purpose: Quantify DF for a process with 4 extractions, 3 back extractions
 - Conditions:

Starting Solution	Extraction Solution	Back extraction solution	
4 M nitric acid	30% vol.% TBP, 70 vol.% kerosene	0.024 M ferrous sulfamate in 4 M nitric acid
